#### 005AProduct: Medline Hemo-force

I am prescribing a Medline Hemo-force System for use during the intra-op and immediate post-op phase during my patient's care. I certify that the Hemo-force Device is medically indicated, and in my opinion, a reasonable prophylactic measure with the reference to the accepted standards of medical practice and treatment to promote optimal blood flow that may be compromised during a surgical procedure.

#### Medline Hemo-Force:

П	Sleeves	(bilateral	ар	plication
---	---------	------------	----	-----------

☐ Sleeves (unilateral-only applicable for ankle/ knee procedures)

#### **Physician's Letter of Medical Necessity**

In my evaluation of this patient, I have noted that there is a higher risk of developing Deep Venous Thrombosis (DVT), due to the type of surgery performed in combination with other risk factors. I am prescribing DVT Prophylaxis involving the use of sequential compression device and the necessary application which will significantly decrease the risk factors associated with a DVT, such as Pulmonary Embolism (PE). Deep vein thrombosis and it's known complications such as a pulmonary embolism can have major complications associated with these surgeries, resulting in significant morbidity and mortality rates, as stated by the American College of Chest Physicians.

Significant published data is available on the incidents of DVT/PE, the effectiveness of various prophylactic techniques, and the risk of hemorrhage when heparin is used, all of which provide positive and compelling evidence in support for the use of intermittent compression devices in DVT prevention. Impaired venous blood flow in post abdominal/orthopedic surgeries, trauma and other conditions that impede, or significantly decreased ambulation of patients most and certainly will decrease circulation which can result in edema, pain, delayed healing and increase risk of DVT and PE. The clinical trials show clear evidence that these complications and risk factors can be significantly minimized with the use of the pneumatic compression devices.

For these reasons, sequential compression sleeves are prescribed for this patient to maximize the most positive outcome of surgery and minimize the potential for serious complications. I have successfully used this device in my practice and patients tolerate the treatment protocol with a very high degree of compliance. I feel this protocol is the most beneficial and cost-effective treatment for my patients in greatly reducing the development of DVT, which when ignored can result in significant increase in morbidity and mortality and increased utilization of health care resources and dollars.

My signature below acknowledges, that in my professional judgment, the prescribed item is medically indicated & necessary. The information is consistent with the most current literature and accepted standards of care for the surgical patient and it's improved post-operative outcomes.
